

Ultrasound in Urgent Pathologies: development, interest and limits

Ultrasound has seen gigantic technical progress in recent years. This is a frequent and accessible paraclinical examination required for the exploration of several pathologies.

Ultrasound, thanks to its accessibility, its low cost and its harmlessness, becomes a very practical tool for many practitioners in different specialties such as: anesthetist, radiologist, gynecologists and especially in urgent pathologies.

Gynecological emergencies are the prime example of a systematic use of ultrasound, and hydrosoneography represents a technical advance in ultrasound which in many cases meets the demands of obstetrician gynecologists for pelvic exploration, in particular the uterine cavity.

It is through this special issue that I appeal to all these practitioners to share their experience with this tool, especially in urgent pathologies. These experiences which will be very enriching for us; will make it possible to exchange and refine its indications and to bypass any possible complications.

Key words: Ultrasound, Urgent Pathologies, Gynecological emergencies, Anesthetist, Radiologist, Gynecologists

Deadline: 13 January 2022
